

WEB DEVELOPMENT & DESIGN INTERNSHIP REPORT

HIORBAI

A Modern Frontend AI Company Website

Developed By

Himanshu Chenda

Internship Organization

Synent Technology

Domain

Web Development & Design

Task Title

HiorbAI – Frontend AI Company Website

Technologies Used

HTML5

CSS3

JavaScript

Chart.js

LocalStorage

Submission Year

2026

Acknowledgement

This Web Development & Design Internship at Synent Technology provided me with valuable practical experience in frontend web development. It helped me improve my understanding of modern web technologies and strengthened my skills in designing responsive and interactive web applications through hands-on project work.

The internship gave me the opportunity to apply theoretical concepts in a practical environment. Throughout the project, I enhanced my knowledge of user interface design, responsive layouts, browser storage, and JavaScript-based interactivity. It also improved my problem-solving abilities and overall understanding of frontend development.

The project, **HiorbAI**, was developed as a frontend-only AI company website using HTML, CSS, JavaScript, Chart.js, and LocalStorage. It demonstrates modern web development concepts, including responsive design, interactive features, data visualization, and client-side data management, while showcasing practical implementation of frontend technologies.

I sincerely thank Synent Technology for providing this learning opportunity and valuable experience. I also appreciate the support and guidance provided throughout the internship, which contributed to the successful completion of this project.

Abstract

The rapid growth of Artificial Intelligence has significantly increased the demand for modern and interactive company websites that effectively showcase AI-based services and solutions. The objective of this project is to design and develop HiorbAI, a responsive frontend-only AI company website that demonstrates modern web development concepts without using any backend technologies.

The website has been developed using HTML5, CSS3, JavaScript, Chart.js, and LocalStorage. It provides a clean and user-friendly interface with multiple pages, including Home, About, Services, AI Project Cost Calculator, AI Readiness Assessment, Dashboard, and Contact. Various interactive features such as dark/light mode, responsive layouts, reusable components, charts, browser-based data storage, and smooth user interactions have been implemented to improve user experience.

The project follows a modular frontend architecture, making the website easy to maintain and extend in the future. LocalStorage has been used to store calculator history, assessment results, contact form data, and user preferences, allowing users to retain information even after refreshing the browser.

This project demonstrates practical implementation of frontend development concepts and provides a strong foundation for future enhancements such as backend integration, authentication, cloud deployment, and AI-powered services. The overall project successfully meets the objectives of creating a professional, responsive, and interactive AI company website suitable for portfolio presentation and internship evaluation.

Introduction

The rapid advancement of Artificial Intelligence has significantly transformed the software industry by enabling businesses to automate repetitive tasks, improve customer engagement, and make intelligent decisions using data-driven solutions. Modern organizations increasingly require websites that effectively present AI services while providing interactive tools for users to explore different business solutions. As a result, frontend web development has become an essential skill for designing visually appealing, responsive, and user-friendly applications.

The HiorbAI project was developed to simulate the official website of an AI-based software company. Rather than creating a static informational website, the project focuses on building a dynamic and interactive frontend application that demonstrates practical web development concepts. The website provides information about AI services, estimates project costs, evaluates AI readiness through a questionnaire, visualizes analytical data using charts, and stores user preferences locally within the browser.

The entire project has been developed using HTML5, CSS3, JavaScript, Chart.js, and LocalStorage without relying on backend technologies or external frameworks. This approach highlights core frontend development skills while ensuring the application remains lightweight, responsive, and easy to understand.

The project emphasizes reusable components, responsive layouts, modern user interface design, browser storage techniques, and interactive user experiences. It demonstrates how frontend technologies can be effectively combined to create professional web applications suitable for portfolios, internships, and academic projects.

PROJECT OBJECTIVES

The primary objective of the HiorbAI project is to design and develop a modern frontend-only AI company website that demonstrates professional web development skills using HTML, CSS, JavaScript, Chart.js, and LocalStorage. The website has been designed to simulate the online presence of an AI solutions company while providing interactive tools that enhance user engagement.

The specific objectives of the project are:

- To design a responsive and visually appealing multi-page website.
- To implement reusable navigation and footer components.
- To create a modern user interface inspired by SaaS and AI company websites.
- To develop an AI Project Cost Calculator capable of generating estimated project costs, timelines, and team recommendations.
- To implement an AI Readiness Assessment that evaluates organizational preparedness using a questionnaire and graphical analytics.
- To visualize assessment and calculator data using Chart.js.
- To use LocalStorage for storing theme preferences, calculator history, assessment results, and contact form data.
- To ensure responsive compatibility across desktop, tablet, and mobile devices.
- To create a clean, organized, and maintainable frontend project suitable for internship evaluation and portfolio presentation.

The successful completion of these objectives demonstrates the practical application of modern frontend development concepts and showcases the ability to develop interactive web applications without relying on backend technologies.

PROJECT FEATURES

The HiorbAI website includes multiple interactive features designed to provide users with a professional browsing experience while demonstrating practical frontend development concepts.

Responsive Design

The website automatically adjusts its layout for desktops, tablets, and smartphones, ensuring a consistent user experience across different devices.

Dark and Light Theme

Users can switch between dark and light modes. The selected theme is stored using LocalStorage and is automatically restored when the website is reopened.

Sticky Navigation

The navigation bar remains visible while scrolling, providing quick access to different pages.

Scroll Progress Indicator

A progress bar at the top of the page indicates the user's scrolling progress.

AI Project Cost Calculator

Users can estimate project cost, duration, complexity level, and recommended team size based on selected project requirements.

AI Readiness Assessment

The assessment evaluates an organization's readiness to adopt AI technologies through a questionnaire, with results displayed using charts and feedback.

Analytics Dashboard

The dashboard summarizes stored data and visualizes information using Chart.js.

Contact Form

Users can submit inquiries through a responsive contact form, with data stored locally using `LocalStorage` for demonstration purposes.

These features demonstrate practical frontend development techniques while providing an interactive and user-friendly experience.

TECHNOLOGIES USED

The HiorbAI project has been developed entirely using frontend technologies. Each technology plays a specific role in creating an interactive, responsive, and visually appealing web application.

HTML5

HTML5 is used to create the structure of every webpage. It provides semantic elements that improve readability, maintainability, and accessibility. Separate HTML files have been created for Home, About, Services, Calculator, Assessment, Dashboard, and Contact pages.

CSS3

CSS3 is responsible for the visual appearance of the website. It provides responsive layouts, typography, spacing, animations, transitions, hover effects, glassmorphism, gradients, and dark/light theme styling. Media queries ensure that the website functions correctly across different screen sizes.

JavaScript

JavaScript provides interactivity throughout the application. It controls navigation behavior, page interactions, form validation, search functionality, calculator logic, assessment scoring, dashboard updates, theme switching, and `LocalStorage` operations.

Chart.js

Chart.js is used to generate responsive charts for displaying AI readiness assessment results and dashboard analytics. It provides an attractive visual representation of user-generated data.

LocalStorage

`LocalStorage` stores browser-based information such as theme preference, calculator history, assessment scores, dashboard statistics, and contact form data.

This allows information to persist after refreshing the page without requiring a backend database.

Together, these technologies create a complete frontend application that demonstrates modern web development principles while remaining lightweight and easy to deploy.

SYSTEM ARCHITECTURE

The HiorbAI project follows a modular frontend architecture where each webpage is responsible for presenting a specific functionality while sharing common components such as the navigation bar and footer.

The application begins with the Home page, which introduces the company and provides navigation to all available modules. Individual pages handle specialized tasks such as displaying company information, presenting AI services, calculating project estimates, assessing AI readiness, visualizing analytical data, and collecting user inquiries.

JavaScript serves as the central controller for user interactions. It manages page behavior, updates dynamic content, processes form submissions, performs calculations, and stores information in LocalStorage.

Chart.js is integrated to generate graphical representations of assessment scores and dashboard statistics. LocalStorage acts as a lightweight client-side storage mechanism that preserves user-generated information across browser sessions.

Since the project is entirely frontend-based, all processing occurs within the user's browser. No backend server or database is required, making the application lightweight, portable, and easy to deploy using GitHub Pages or any static web hosting platform.

WORKING METHODOLOGY

The development of the HiorbAI project followed a systematic approach to ensure modularity, maintainability, and responsiveness.

Initially, the project requirements were identified by analyzing the features commonly found in modern AI company websites. Based on these requirements, a folder structure was created to organize HTML pages, CSS stylesheets, JavaScript files, reusable components, screenshots, and project documentation.

The website interface was then designed using HTML5 and CSS3 with emphasis on responsive layouts, modern typography, and consistent color schemes. Reusable navigation and footer components were developed to maintain consistency across all pages.

JavaScript functionality was added incrementally to implement interactive features including navigation control, project cost estimation, AI readiness assessment, dashboard analytics, search functionality, theme switching, and LocalStorage integration.

After implementing all functionalities, extensive testing was conducted to verify responsiveness, browser compatibility, LocalStorage behavior, chart rendering, navigation, and user interactions. Identified issues were corrected to ensure a smooth user experience.

Finally, project documentation, screenshots, README, and repository organization were completed to prepare the project for internship submission and portfolio presentation.

PROJECT MODULES AND OUTPUT SCREENS

The HiorbAI website consists of multiple interconnected modules, each developed to perform a specific function. Every module follows a consistent design, responsive layout, and reusable component structure. The following screenshots illustrate the major pages implemented in the project along with a brief description of their functionality.

Figure 1: Home Page

Figure 2: About Page

Figure 3: Services Page

Figure 4: Calculator Page

Figure 5: Assessment Page

Figure 6: Dashboard Page

Figure 7: Contact Page

The screenshots shown above represent the complete implementation of the HiorbAI frontend application. Each page has been designed with a modern responsive layout while maintaining consistent navigation, typography, and styling throughout the website. Interactive features such as the AI Project Cost Calculator, AI Readiness Assessment, Analytics Dashboard, Dark Mode, LocalStorage integration, responsive search functionality, and contact form collectively demonstrate practical frontend web development skills using HTML5, CSS3, JavaScript, Chart.js, and LocalStorage.

CHALLENGES FACED

During the development of the HiorbAI project, several practical challenges were encountered. Initially, integrating reusable navigation and footer components required careful handling to ensure consistency across all pages. The implementation of the AI Project Cost Calculator involved multiple calculations, conditional logic, and dynamic content updates, which required extensive testing.

Another challenge was maintaining proper alignment of responsive layouts across different screen sizes. The dark/light theme functionality also required debugging to correctly save and retrieve user preferences using LocalStorage. Dashboard charts and browser storage synchronization were tested multiple times to ensure accurate visualization of user-generated data. These challenges significantly improved problem-solving skills and provided practical experience in debugging frontend applications.

LEARNING OUTCOMES

This internship project provided valuable practical experience in frontend web development. Through the development of HiorbAI, I gained a deeper understanding of responsive web design, reusable components, browser storage, JavaScript programming, user interface development, and data visualization using Chart.js.

The project also enhanced my debugging skills, project organization techniques, GitHub repository management, documentation practices, and software testing methodologies. Overall, the internship strengthened my confidence in developing complete frontend applications suitable for real-world scenarios and professional portfolios.

FUTURE SCOPE

Although the current version of HiorbAI is a frontend-only application, it can be significantly expanded in the future. Backend technologies such as Node.js, Express.js, or Django can be integrated to store project data in a database and implement secure user authentication.

Additional features such as AI-powered chat support, real-time project tracking, email notifications, payment gateway integration, and an administrative management portal can also be developed. These enhancements would transform the project into a fully functional commercial web application suitable for deployment in real business environments.

CONCLUSION

The HiorbAI project successfully demonstrates the practical implementation of modern frontend web development concepts using HTML5, CSS3, JavaScript, Chart.js, and LocalStorage. The application combines responsive design, interactive user interfaces, browser-based data storage, and analytical visualization to simulate the website of an AI solutions company.

The successful completion of this project reflects the knowledge and skills acquired during the Web Development & Design Internship. It also serves as a valuable portfolio project that demonstrates the ability to design, develop, test, and document a complete frontend application using industry-standard development practices.
